

Technical Information

Smartec CLD18

Compact inductive conductivity measurement for the food and beverage industry

Application

Compact measuring system for inductive conductivity measurement in liquids with medium to high conductivity. The structure is made from highly durable, food-safe polyetheretherketone (PEEK). The excellent chemical resistance properties of the sensor mean it can also be used in applications outside the food industry. The measuring system is perfectly suited for:

- Phase separation of product/water mixtures in the beverage industry
- Control of cleaning-in-place facilities (CIP), concentration control, separation in the cleaning return line
- Industrial water monitoring
- Rinsing processes in pickling plants

Your benefits

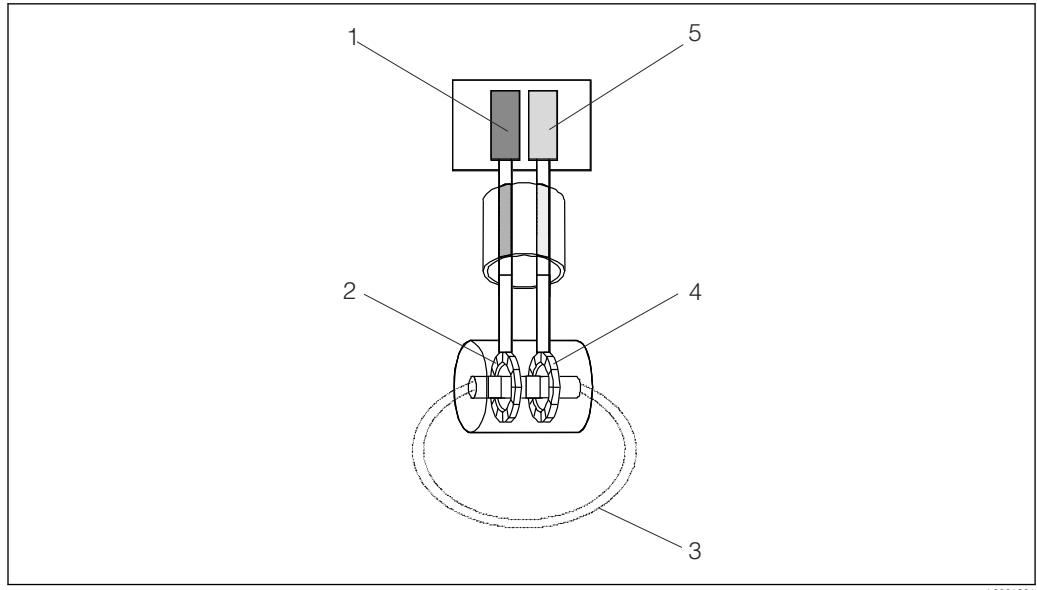

- Hygienic sensor design in accordance with EHEDG and 3-A requirements, no risk of recontamination
- Stainless steel or plastic transmitter housing, IP 69K, can be cleaned with high-pressure steam
- High level of repeatability, 0.5 % of reading, always guarantees same separation or monitoring

Function and system design

Measuring principle

Inductive conductivity measurement

An oscillator (1) generates an alternating magnetic field in the primary coil (2), which induces a current flow (3) in the medium. The strength of the current depends on the conductivity and thus on the ion concentration in the medium. The current flow in the medium, in turn, generates a magnetic field in the secondary coil (4). The resulting induced current is measured by the receiver (5) and used to determine the conductivity.

■ 1 *Inductive conductivity measurement*

- 1 *Oscillator*
- 2 *Primary coil*
- 3 *Current flow in the medium*
- 4 *Secondary coil*
- 5 *Receiver*

Advantages of inductive conductivity measurement:

- No electrodes and therefore no polarization effects
- Accurate measurement in media with a high degree of pollution and a tendency to form buildup
- Complete galvanic isolation of the measurement and the medium

Key properties**■ Hygiene**

The PEEK sensor (polyetheretherketone) has excellent chemical, mechanical and thermal resistance properties, is entirely seamless and gap-free and is therefore safe to use in hygienic applications. The sensor has 3A approval which is required for the hygiene sector. All wetted materials are FDA-listed. The sensor has been designed according to the latest guidelines of the American Society of Mechanical Engineers - Bioprocessing Equipment (ASME BPE) and meets the requirements of EC Regulation No. 1935/2004 of the European Parliament on materials and articles intended to come into contact with food.

■ Process connections

The measuring system is available with all the process connections commonly used in the hygiene sector. The measuring system is also available with a G1½ process adapter and 2¼" coupling nut for use in non-hygienic areas.

■ Process temperature, process pressure

The sensor is suitable for continuous operating temperatures up to 110 °C (230 °F). It can be operated up to 130 °C (266 °F) for short periods (max. 60 min) for sterilization phases. The pressure resistance is 13 bar (188 psi) abs up to 50 °C (122 °F).

If the PVC process adapter is used, the maximum pressure resistance drops to 9 bar (130 psi) abs at 25 °C (77 °F) and the maximum process temperature drops to 60 °C (140 °F).

■ Temperature measurement

A Pt 1000 temperature sensor is integrated into the sensor. This ensures efficient phase separation at different and quickly changing process temperatures. The temperature sensor is embedded in the PEEK body.

■ Temperature compensation

Linear temperature compensation with user-configurable temperature coefficients α is implemented in the measuring system.

Input

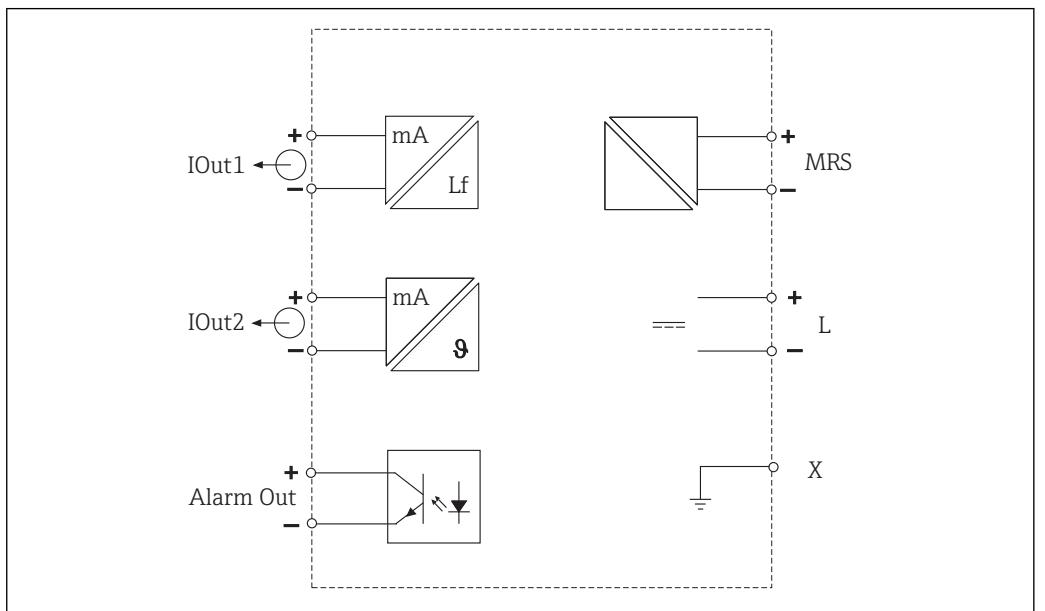

Measured values	Conductivity Temperature	
Measuring range	Conductivity: Temperature:	Recommended range: 200 µS/cm to 1000 mS/cm (uncompensated) -10 to +130 °C (+14 to +266 °F)
Temperature measurement	Pt 1000	
Binary input	The binary input is used for measuring range switching.	
	Voltage range 0 V to 30 V Voltage HIGH min. 12 V Voltage LOW max. 9.0 V Current consumption at 24 V 30 mA Undefined voltage range 9.0 to 12 V	

Output

Output signal	Conductivity: Temperature:	0 / 4 to 20 mA, galvanically isolated 0 / 4 to 20 mA, galvanically isolated
Load	Max. 500 Ω	
Characteristic	Linear	
Signal resolution	Resolution: Accuracy:	> 13 bit $\pm 20 \mu\text{A}$
Alarm output	The alarm output is implemented as an "open collector".	
	Max. current Max. voltage	200 mA 30 V DC
	Error or device without supply voltage No error	Alarm output blocked (0 mA) Alarm output open (up to 200 mA)

Performance characteristics

Response time	Conductivity: Temperature:	$t_{95} < 1.5$ s $t_{90} < 20$ s
Maximum measured error	Conductivity: Temperature: Signal outputs	$\pm (2.0\% \text{ of measured value} + 20 \mu\text{S/cm})$ ± 1.5 K $\pm 50 \mu\text{A}$
Repeatability	Conductivity:	max. 0.5 % of measured value $\pm 5 \mu\text{S/cm} \pm 2$ digits
Cell constant	11.0 cm ⁻¹	
Temperature compensation	Range Types of compensation	-10 to +130 °C (+14 to +266 °F) ■ None ■ Linear with user-configurable temperature coefficient
Reference temperature	25 °C (77 °F)	

Installation

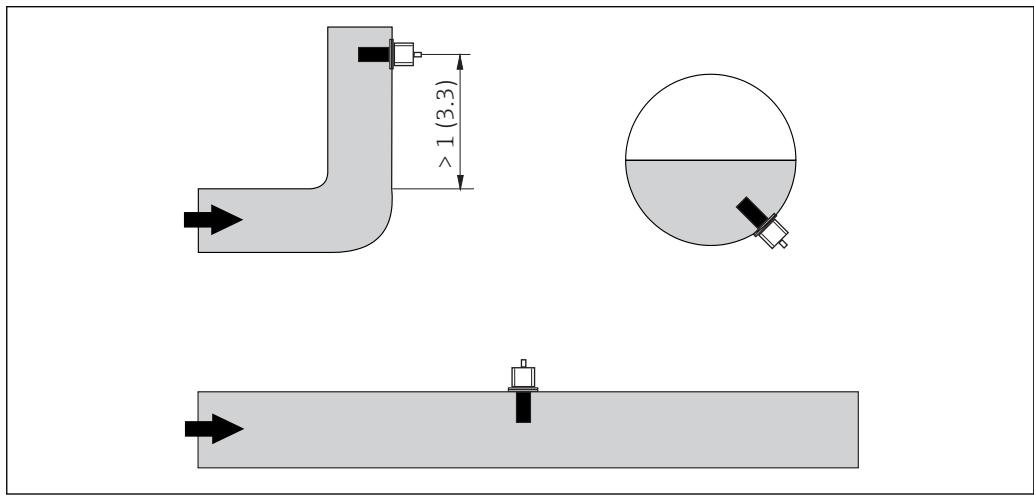

Installation instructions

For a 3-A compliant installation, the following must be noted:

After the instrument is installed its hygienic integrity shall be maintained. The instrument shall be installed with the leakage detection at the lowest point of the assembly. Furthermore all process connections must be 3-A compliant.

The sensor must be completely immersed in the medium. Avoid air bubbles in the area of the sensor.

A0017691

4 Orientation of conductivity sensors. Engineering unit: m (ft)

If the flow direction changes (after pipe bends), turbulence in the medium can result.

- Install the sensor at a distance of at least 1 m (3.3 ft) downstream from a pipe bend.

The product should flow along the hole of the sensor (see the arrows on the housing). The symmetrical measuring channel allows flow in both directions.

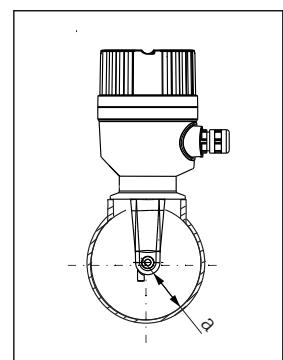

In confined installation conditions, the walls affect the ionic current in the liquid. This effect is offset by what is referred to as the installation factor. The installation factor can be entered in the transmitter for the measurement or the cell constant is corrected by multiplying by the installation factor.

The value of the installation factor depends on the diameter and the conductivity of the pipe nozzle as well as the distance a between the sensor and the wall.

The installation factor can be disregarded ($f = 1.00$) if the distance to the wall is sufficient ($a > 20$ mm, from DN 60).

If the distance to the wall is smaller, the installation factor increases for electrically insulating pipes ($f > 1$) and decreases for electrically conductive pipes ($f < 1$).

It can be measured using calibration solutions, or a close approximation can be determined from the following diagram.

Operability

Display and operating elements

A0018963

10 Display and keys of the CLD18

- 1 Parameters
- 2 Measured value
- 3 Unit
- 4 Operating keys

The ASTN display (Advanced Super Twisted Nematic) is split into two sections. The segment section displays the measured value. The dot-matrix section displays the parameter and unit. The operating texts are displayed in English.

In the event of an error the device automatically alternates between displaying the error and the measured value.

Certificates and approvals

Hygiene	<p>FDA All materials in contact with the product are FDA-listed materials (apart from the PVC process connections).</p> <p>EHEDG Certified cleanability according to EHEDG Type EL Class I.</p> <p>i When using the sensor in hygienic applications, please note that the cleanability of the sensor also depends on the way the sensor is installed. To install the sensor in a pipe, use the appropriate and EHEDG-certified flow vessels for the particular process connection.</p> <p>3-A Certified according to 3-A Standard 74- ("3-A Sanitary Standards for Sensor and Sensor Fittings and Connections Used on Milk and Milk Products Equipment").</p> <p>EC Regulation No. 1935/2004 The sensor meets the requirements of EC Regulation No. 1935/2004 on materials and articles intended to come into contact with food.</p>
Pressure approval	Canadian pressure approval for pipes according to ASME B31.3
CE mark	The product meets the requirements of the harmonized European standards. As such, it complies with the legal specifications of the EU directives. The manufacturer confirms successful testing of the product by affixing to it the CE mark.

Ordering information

Product page	www.endress.com/CLD18
Product Configurator	<p>On the product page there is a "Configure" button to the right of the product image Configure.</p> <ol style="list-style-type: none"> 1. Click this button. ↳ The Configurator opens in a separate window. 2. Select all the options to configure the device in line with your requirements. ↳ In this way, you receive a valid and complete order code for the device. 3. Export the order code as a PDF or Excel file. To do so, click the appropriate button on the right above the selection window. <p>i For many products you also have the option of downloading CAD or 2D drawings of the selected product version. Click the tab for this CAD and select the desired file type using picklists.</p>
Scope of delivery	<p>The delivery comprises:</p> <ul style="list-style-type: none"> ▪ A Smartec CLD18 measuring system in the version ordered ▪ Operating Instructions BA01149C/07/EN

Accessories
